listSetIntersection

Your task is to write a function, listSetIntersection, that takes two lists representing two sets and returns a **new** list that represents the intersection of those sets. For example, if the two lists are [4, 3, 1, 7, 6] and [3, 2, 5, 1, 6], you should return a list containing the elements 1, 3, and 6. The result list does not have to be ordered in any particular way. Since the input lists represent sets, you can assume they do not contain any duplicate elements. Your function must **not** modify the input lists.

The Files

list.c Contains the implementation of basic list functions

list.h Contains the definition of the list data structure and function prototypes

testListSetIntersection.c Contains the main function, which reads in two lists from standard input, calls

listSetIntersection, sorts the returned list, and prints out the result.

listSetIntersection.c Contains listSetIntersection, the function you must implement

Makefile A makefile to compile your code

tests/ A directory containing the inputs and expected outputs for some basic tests

A script that uses the tests in the tests directory to autotest your solution. You should

only run this after you have tested your solution manually.

Examples

Your program should behave like these examples:

```
$ ./testListSetIntersection
Enter list 1: 1 3 5 7 9
Enter list 2: 8 6 4 2 0

Set 1: {1, 3, 5, 7, 9}
Set 2: {8, 6, 4, 2, 0}
Intersection: {}
```

```
$ ./testListSetIntersection
Enter list 1:
Enter list 2: 1 8 3 9

Set 1: {}
Set 2: {1, 8, 3, 9}
Intersection: {}
```

```
$ ./testListSetIntersection
Enter list 1: 5 8 3 9 6 7 1 4 2
Enter list 2: 3 2 8 4 0 9

Set 1: {5, 8, 3, 9, 6, 7, 1, 4, 2}
Set 2: {3, 2, 8, 4, 0, 9}
Intersection: {2, 3, 4, 8, 9}
```

You can test your program manually by compiling your code using make, and then running ./testListSetIntersection, as shown above. After you are satisfied with your solution, you can autotest it by running ./autotest. This will run some basic tests on your program.
